

2M x 32 bit DDR Synchronous DRAM (SDRAM)

Advance (Rev. 1.0, Nov. /2015)

Features

- Fast clock rate: 200/250 MHz
- Differential Clock CK & \overline{CK}
- Bi-directional DQS
- DLL enable/disable by EMRS
- Fully synchronous operation
- Internal pipeline architecture
- Four internal banks, 512K x 32-bit for each bank
- Programmable Mode and Extended Mode registers
 - CAS Latency: 2, 2.5, 3
 - Burst length: 2, 4, 8
 - Burst Type: Sequential & Interleaved
- Individual byte write mask control
- DM Write Latency = 0
- Auto Refresh and Self Refresh
- 4096 refresh cycles / 64ms
- Precharge & active power down
- Operating Temperature: $T_A = 0\sim 70^\circ\text{C}$
- Power supplies: $V_{DD} \& V_{DDQ} = 2.5V \pm 0.2V$
- Interface: SSTL_2 I/O Interface
- 144-ball 12 x 12 x 1.4mm FBGA package
 - Pb and Halogen Free

Overview

The EM6A8320 SDRAM is a high-speed CMOS double data rate synchronous DRAM containing 64 Mbits. It is internally configured as a quad 512K x 32 DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CK). Data outputs occur at both rising edges of CK and \overline{CK} . Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of a BankActivate command which is then followed by a Read or Write command. The EM6A8320 provides programmable Read or Write burst lengths of 2, 4, or 8. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence. The refresh functions, either Auto or Self Refresh are easy to use. In addition, EM6A8320 features programmable DLL option. By having a programmable mode register and extended mode register, the system can choose the most suitable modes to maximize its performance. These devices are well suited for applications requiring high memory bandwidth; result in a device particularly well suited to high performance main memory and graphics applications.

Table 1. Ordering Information

Part Number	Clock Frequency	Data Rate	Power Supply	Package
EM6A8320BIA-4H	250MHz	500Mbps/pin	$V_{DD} 2.5V, V_{DDQ} 2.5V$	FBGA
EM6A8320BIA-5H	200MHz	400Mbps/pin	$V_{DD} 2.5V, V_{DDQ} 2.5V$	FBGA

BI: indicates 12 x 12 x 1.4mm FBGA Package

A: indicates Generation Code

H: indicates Pb and Halogen Free

Figure 2. Block Diagram

Ball Descriptions

Table 3. Ball Details

Symbol	Type	Description
CK, \overline{CK}	Input	Differential Clock: CK and \overline{CK} are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of \overline{CK} . Input and output data is referenced to the crossing of CK and \overline{CK} (both directions of the crossing)
CKE	Input	Clock Enable: CKE activates (HIGH) and deactivates (LOW) the CK signal. If CKE goes low synchronously with clock, the internal clock is suspended from the next clock cycle and the state of output and burst address is frozen as long as the CKE remains low. When all banks are in the idle state, deactivating the clock controls the entry to the Power Down and Self Refresh modes.
BA0, BA1	Input	Bank Activate: BA0 and BA1 define to which bank the BankActivate, Read, Write, or BankPrecharge command is being applied.
A0-A10	Input	Address Inputs: A0-A10 are sampled during the Bank Activate command (row address A0-A10) and Read/Write command (column address A0-A7 with A10 defining Auto Precharge) to select one location out of the 512K available in the respective bank. During a Precharge command, A10 is sampled to determine if all banks are to be precharged (A10 = HIGH). The address inputs also provide the op-code during a Mode Register Set or Extended Mode Register Set command.
\overline{CS}	Input	Chip Select: \overline{CS} enables (sampled LOW) and disables (sampled HIGH) the command decoder. All commands are masked when \overline{CS} is sampled HIGH. \overline{CS} provides for external bank selection on systems with multiple banks. It is considered part of the command code.
\overline{RAS}	Input	Row Address Strobe: The \overline{RAS} signal defines the operation commands in conjunction with the \overline{CAS} and \overline{WE} signals and is latched at the positive edges of CK. When \overline{RAS} and \overline{CS} are asserted "LOW" and \overline{CAS} is asserted "HIGH" either the BankActivate command or the Precharge command is selected by the \overline{WE} signal. When the \overline{WE} is asserted "HIGH" the BankActivate command is selected and the bank designated by BA is turned on to the active state. When the \overline{WE} is asserted "LOW" the Precharge command is selected and the bank designated by BA is switched to the idle state after the precharge operation.
\overline{CAS}	Input	Column Address Strobe: The \overline{CAS} signal defines the operation commands in conjunction with the \overline{RAS} and \overline{WE} signals and is latched at the positive edges of CK. When \overline{RAS} is held "HIGH" and \overline{CS} is asserted "LOW" the column access is started by asserting \overline{CAS} "LOW". Then, the Read or Write command is selected by asserting \overline{WE} "HIGH" or "LOW".
\overline{WE}	Input	Write Enable: The \overline{WE} signal defines the operation commands in conjunction with the \overline{RAS} and \overline{CAS} signals and is latched at the positive edges of CK. The \overline{WE} input is used to select the BankActivate or Precharge command and Read or Write command.
DQS0-DQS3	Input / Output	Bidirectional Data Strobe: The DQSx signals are mapped to the following data bytes: DQS0 to DQ0-DQ7, DQS1 to DQ8-DQ15, DQS2 to DQ16-DQ23, DQS3 to DQ24-DQ31.
DM0 - DM3	Input	Data Input Mask: DM0-DM3 are byte specific. Input data is masked when DM is sampled HIGH during a write cycle. DM3 masks DQ31-DQ24, DM2 masks DQ23-DQ16, DM1 masks DQ15-DQ8, and DM0 masks DQ7-DQ0.
DQ0 - DQ31	Input / Output	Data I/O: The DQ0-DQ31 input and output data are synchronized with positive and negative edges of DQS0~DQS3. The I/Os are byte-maskable during Writes.
V _{DD}	Supply	Power Supply: 2.5V ± 0.2V.
V _{SS}	Supply	Ground

V _{DDQ}	Supply	DQ Power: 2.5V ± 0.2V . Provide isolated power to DQs for improved noise immunity.
V _{SSQ}	Supply	DQ Ground: Provide isolated ground to DQs for improved noise immunity.
V _{REF}	Supply	Reference Voltage for Inputs: +0.5*V _{DDQ}
NC	-	No Connect: These pins should be left unconnected.

Operation Mode

Fully synchronous operations are performed to latch the commands at the positive edges of CK. Table 3 shows the truth table for the operation commands.

Table 4. Truth Table (Note (1), (2))

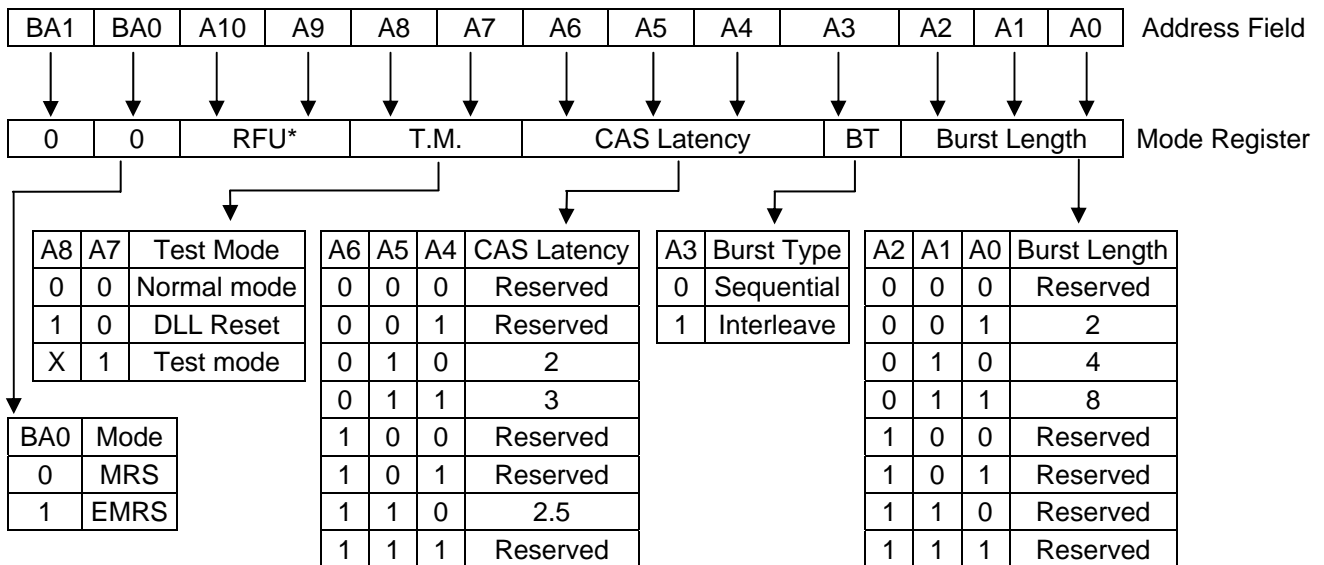

Command	State	CKEn-1	CKEn	DM	BA1	BA0	A10	A9-0	\overline{CS}	\overline{RAS}	\overline{CAS}	\overline{WE}
BankActivate	Idle ⁽³⁾	H	X	X	V	V	Row Address		L	L	H	H

Power Down Mode Exit	Any (Power Down)	L	H	X	X	X	X	X	H	X	X	X
									L	H	H	H
Data Mask Enable	Active	H	X	H	X	X	X	X	X	X	X	X
Data Mask Disable	Active	H	X	L	X	X	X	X	X	X	X	X

- Note:** 1. V=Valid data, X=Don't Care, L=Low level, H=High level
 2. CKEn signal is input level when commands are provided.
 CKEn-1 signal is input level one clock cycle before the commands are provided.
 3. These are states of bank designated by BA signal.
 4. Device state is 2, 4, and 8 burst operation.
 5. Power Down Mode can not enter in the burst operation.

Mode Register Set (MRS)

The Mode Register stores the data for controlling various operating modes of a DDR SDRAM. It programs CAS Latency, Burst Type, and Burst Length to make the DDR SDRAM useful for a variety of applications. The default value of the Mode Register is not defined; therefore the Mode Register must be written by the user. Values stored in the register will be retained until the register is reprogrammed. The Mode Register is written by asserting Low on \overline{CS} , \overline{RAS} , \overline{CAS} , \overline{WE} , BA1 and BA0 (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). The state of address pins A0~A10 and BA0, BA1 in the same cycle in which \overline{CS} , \overline{RAS} , \overline{CAS} and \overline{WE} are asserted Low is written into the Mode Register. A minimum of two clock cycles, tMRD, are required to complete the write operation in the Mode Register. The Mode Register is divided into various fields depending on functionality. The Burst Length uses A0~A2, Burst Type uses A3, and CAS Latency (read latency from column address) uses A4~A6. A logic 0 should be programmed to all the undefined addresses to ensure future compatibility. Reserved states should not be used to avoid unknown device operation or incompatibility with future versions. Refer to the table for specific codes for various burst lengths, burst types and CAS latencies.

Table 5. Mode Register Bitmap

* Note: RFU (Reserved for future use) must be set to "0" during MRS cycle.

- Burst Length Field (A2~A0)**

This field specifies the data length of column access using the A2~A0 pins and selects the Burst Length to be 2, 4, 8.

Table 6. Burst Length

A2	A1	A0	Burst Length
0	0	0	Reserved
0	0	1	2
0	1	0	4
0	1	1	8
1	0	0	Reserved
1	0	1	Reserved
1	1	0	Reserved
1	1	1	Reserved

- Addressing Mode Select Field (A3)

The Addressing Mode can be one of two modes, either Interleave Mode or Sequential Mode. Both Sequential Mode and Interleave Mode support burst length of 2, 4 and 8.

Table 7. Addressing Mode

A3	Addressing Mode
0	Sequential
1	Interleave

- Burst Definition, Addressing Sequence of Sequential and Interleave Mode

Table 8. Burst Address ordering

Burst Length	Start Address			Sequential	Interleave
	A2	A1	A0		
2	X	X	0	0, 1	0, 1
	X	X	1	1, 0	1, 0
4	X	0	0	0, 1, 2, 3	0, 1, 2, 3
	X	0	1	1, 2, 3, 0	1, 0, 3, 2
	X	1	0	2, 3, 0, 1	2, 3, 0, 1
	X	1	1	3, 0, 1, 2	3, 2, 1, 0
8	0	0	0	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
	0	0	1	1, 2, 3, 4, 5, 6, 7, 0	1, 0, 3, 2, 5, 4, 7, 6
	0	1	0	2, 3, 4, 5, 6, 7, 0, 1	2, 3, 0, 1, 6, 7, 4, 5
	0	1	1	3, 4, 5, 6, 7, 0, 1, 2	3, 2, 1, 0, 7, 6, 5, 4
	1	0	0	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
	1	0	1	5, 6, 7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
	1	1	0	6, 7, 0, 1, 2, 3, 4, 5	6, 7, 4, 5, 2, 3, 0, 1
	1	1	1	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

- CAS Latency Field (A6~A4)

This field specifies the number of clock cycles from the assertion of the Read command to the first read data. The minimum whole value of CAS Latency depends on the frequency of CK. The minimum whole value satisfying the following formula must be programmed into this field. $t_{CAC}(\min) \leq \text{CAS Latency} \times t_{CK}$

Table 9. CAS Latency

A6	A5	A4	CAS Latency
0	0	0	Reserved
0	0	1	Reserved
0	1	0	2 clocks
0	1	1	3 clocks
1	0	0	Reserved
1	0	1	Reserved
1	1	0	2.5 clocks
1	1	1	Reserved

- Test Mode field (A8~A7)

These two bits are used to enter the test mode and must be programmed to "00" in normal operation.

Table 10. Test Mode

A8	A7	Test Mode
0	0	Normal mode
1	0	DLL Reset

- (BA0, BA1)

Table 11. MRS/EMRS

BA1	BA0	A10 ~ A0
0	0	MRS Cycle
0	1	Extended Functions (EMRS)

Extended Mode Register Set (EMRS)

The Extended Mode Register Set stores the data for enabling or disabling DLL and selecting output driver strength. The default value of the extended mode register is not defined, therefore must be written after power up for proper operation. The Extended Mode Register is written by asserting Low on \overline{CS} , \overline{RAS} , \overline{CAS} , \overline{WE} , BA1 and BA0 (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). The state of A0 ~ A10 and BA1 are written in the mode register in the same cycle as \overline{CS} , \overline{RAS} , \overline{CAS} , and \overline{WE} going low. The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the extended mode register. A1 is used for setting driver strength. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. Refer to the table for specific codes.

Table 12. Extended Mode Register Bitmap

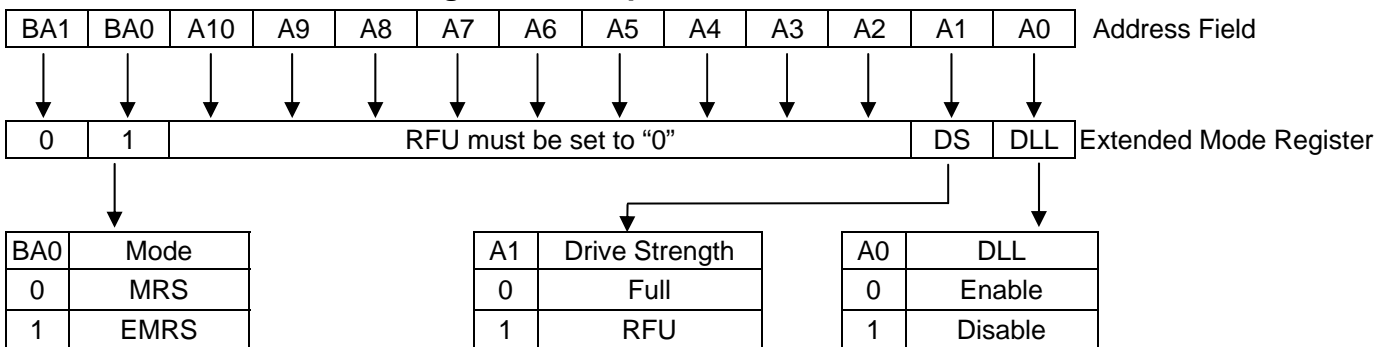

Table 13. Absolute Maximum Rating

Symbol	Item	Values	Unit
V _{I/O}	Voltage on I/O Pins Relative to V _{SS}	- 0.5 ~ V _{DDQ} + 0.5	V
V _{DD} , V _{DDQ}	Voltage on V _{DD} , V _{DDQ} Supply Relative to V _{SS}	- 1 ~ 3.6	V
V _{IN}	Voltage on Inputs Relative to V _{SS}	- 1 ~ 3.6	V
T _A	Ambient Temperature	0 ~ 70	°C
T _{STG}	Storage Temperature	- 55 ~ 150	°C
P _D	Power Dissipation	1	W
I _{OS}	Short Circuit Output Current	50	mA

Note: Absolute maximum DC requirements contain stress ratings only. Functional operation at the absolute maximum limits is not implied or guaranteed. Extended exposure to maximum ratings may affect device reliability.

Table 14. Recommended D.C. Operating Conditions (V_{DD} = 2.5V ± 0.2V, T_A = 0~70 °C)

Symbol	Parameter	Min.	Max.	Unit
V _{DD}	Power Supply Voltage	2.3	2.7	V
V _{DDQ}	Power Supply Voltage (for I/O Buffer)	2.3	2.7	V
V _{REF}	Input Reference Voltage	0.49*V _{DDQ}	0.51* V _{DDQ}	V
V _{IH} (DC)	Input High Voltage (DC)	V _{REF} + 0.15	V _{DDQ} + 0.3	V
V _{IL} (DC)	Input Low Voltage (DC)	-0.3	V _{REF} - 0.15	V
V _{TT}	Termination Voltage	V _{REF} - 0.04	V _{REF} + 0.04	V
V _{IN} (DC)	Input Voltage Level, CK and \overline{CK} inputs	-0.3	V _{DDQ} + 0.3	V
V _{ID} (DC)	Input Different Voltage, CK and \overline{CK} inputs	0.36	V _{DDQ} + 0.6	V
I _I	Input leakage current	-2	2	μA
I _{OZ}	Output leakage current	-5	5	μA
I _{OH}	Output High Current (V _{OH} = 1.95V)	-16.2	-	mA
I _{OL}	Output Low Current (V _{OL} = 0.35V)	16.2	-	mA

Note: All voltages are referenced to V_{SS}.

Table 15. Capacitance (V_{DD} = 2.5V, f = 1MHz, T_A = 25 °C)

Symbol	Parameter	Min.	Max.	Delta	Unit
C _{IN1}	Input Capacitance (CK, \overline{CK})	1.5	2.5	0.25	pF
C _{IN2}	Input Capacitance (All other input-only pins)	1.5	2.5	0.5	pF
C _{I/O}	DQ, DQS, DM Input/Output Capacitance	3.5	4.5	0.5	pF

Note: These parameters are guaranteed by design, periodically sampled and are not 100% tested

Table 16. D.C. Characteristics ($V_{DD} = 2.5V \pm 0.2V$, $T_A = 0\sim 70^\circ C$)

tDSH	DQS falling edge hold time from CK	0.2	-	0.2	-			

Table 18. Recommended A.C. Operating Conditions ($V_{DD} = 2.5V \pm 0.2V$, $T_A = 0\sim 70\text{ }^\circ\text{C}$)

Symbol	Parameter	Min.	Max.	Unit
V_{IH} (AC)	Input High Voltage (AC)	$V_{REF} + 0.31$	-	V
V_{IL} (AC)	Input Low Voltage (AC)	-	$V_{REF} - 0.31$	V
V_{ID} (AC)	Input Different Voltage, CK and \overline{CK} inputs	0.7	$V_{DDQ} + 0.6$	V
V_{IX} (AC)	Input Crossing Point Voltage, CK and \overline{CK} inputs	$0.5 * V_{DDQ} - 0.2$	$0.5 * V_{DDQ} + 0.2$	V

Note:

- 1) Enables on-chip refresh and address counters.
- 2) Min(t_{CL} , t_{CH}) refers to the smaller of the actual clock low time and actual clock high time as provided to the device.
- 3) t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ), or begins driving (LZ).
- 4) The specific requirement is that DQS be valid (High, Low, or at some point on a valid transition) on or before this CLK edge. A valid transition is defined as monotonic, and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on t_{DQSS} .
- 5) The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
- 6) For command/address and CK & \overline{CK} slew rate $1.0V/ns$.
- 7) A maximum of eight AUTO REFRESH commands can be posted to any given DDR SDRAM device.
- 8) Power-up sequence is described in Note 11
- 9) A.C. Test Conditions

Table 19. SSTL _2 Interface

Reference Level of Output Signals (V_{REF})	$0.5 * V_{DDQ}$
Output Load	Reference to the Test Load
Input Signal Levels	$V_{REF} + 0.31\text{ V} / V_{REF} - 0.31\text{ V}$
Input Signals Slew Rate	1 V/ns
Reference Level of Input Signals	$0.5 * V_{DDQ}$

10) Figure 2 represents the timing reference load used in defining the relevant timing parameters of the part. It is not intended to be either a precise representation of the typical system environment nor a depiction of the actual load presented by a production tester. System designers use IBIS or other simulation tools to correlate the timing reference load to a system environment is suggested.

Figure 3. SSTL_2 A.C. Test Load

11) Power up Sequence

Power up must be performed in the following sequence.

- 1) Apply power to V_{DD} before or at the same time as V_{DDQ} , V_{TT} and V_{REF} when all input signals are held "NOP" state and maintain CKE "LOW".
- 2) Start clock and maintain stable condition for minimum $200\mu\text{s}$.
- 3) Issue a "NOP" command and keep CKE "HIGH"
- 4) Issue a "Precharge All" command.
- 5) Issue EMRS – enable DLL.
- 6) Issue MRS – reset DLL. (An additional 200 clock cycles are required to lock the DLL).
- 7) Precharge all banks of the device.
- 8) Issue two or more Auto Refresh commands.
- 9) Issue MRS – with A8 to low to initialize the mode register.
